

## RRMac and EZSource partnership

---

### Accelerating the implementation of modern software change management and IDE's

The partnership between EZSource and RRMac Associates brings a unique approach to software change management, with an integrated, high quality approach to assess and deliver ROI with best in class tools to support the end to end implementation as well as underpinning the introduction of modern graphical IDEs for z/OS based applications.

As part of the implementation the existing application assets need to be discovered, verified and understood prior to the migration. The combination of RRMac's unparalleled experience alongside the EZSource applications analysis platform ensures both timescales, risks, and costs are tightly managed. The RRMac team has decades of experience managing implementations, conversions, enhancements, customizations as well as day to day SCM support and management for any size company. Their experience in Corporate Governance and Risk Management allows them to look not only at the data management process but also the external factors that affect the security of a company's sensitive data and files. By partnering with EZSource, RRMac can more quickly and efficiently identify a customer's application assets across the enterprise and convert them from older legacy products to modern SCM's and IDE's, thus providing a faster ROI on software investments.

EZSource is an Eclipse enabled product suite integrated with [ChangeMan](#), [Endevor](#), [ISPW](#) and both IBM RTC and RDz which provides robust, automated analysis and metrics for the entire application lifecycle. Coupled with integrated Software Change Management (SCM), it allows organizations to fully understand, improve and control the change process from a productivity, cost reduction and compliance perspective.

When performed manually, industry figures conservatively estimate that analysis alone consumes at least 30% of all skilled application management, with manual analysis results typically incomplete and error prone increasing risk and cost and decreasing compliance.

With EZSource and RRMac, our customers can tightly integrate application analysis into the lifecycle to drive higher levels of quality and reduced levels of complexity. For example:

- ✓ Definition and enforcement of coding standards and rules, integrated with Source Code Management (SCM) under Eclipse with [ChangeMan](#), [Endevor](#), [ISPW](#)
- ✓ Integration under Eclipse with IBM RTC and RDz for developer productivity
- ✓ Identification of candidates for refactoring combined with impact analysis to identify interdependencies and control flow drive high productivity with a high quality end deliverable
- ✓ Automated analysis of source code members making up a production release to improve application maintenance, deployment and support

The EZSource suite comprises:

- ✓ EZSource:Enterprise Server common platform for our EZSource product suite combined with external integration (SCM, scheduling etc.) providing fully automated capability to understand the dependencies for all IT components and integrating with your existing tooling
- ✓ EZSource:Analyze - Eclipse based analysis and reporting across platforms, environments and languages (mainframe and open) based on our open repository with SCM synchronized updates
- ✓ EZSource:Dashboard - Web based dashboard correlating application metrics and external data to provide "at a glance", customizable management information.
